INTRODUCTION

FOREWORD

This report summarizes data compiled from original birth, death, stillbirth, marriage, and dissolution (of marriage) records filed with the Office of Vital Statistics (VS) as required by law. Standard forms recommended by the U.S. Public Health Conference on Records and Statistics are used for certificates of birth, death, and fetal death (stillbirth).

Responsibility for filing birth certificates lies with physician, midwife, or other attendant. Undertakers, or persons acting as such, are legally charged with filing death and fetal death (of 20 or more weeks gestation) certificates. These are submitted to local registrars who in turn forward to VS. VS receives marriage and dissolution records directly from the various courts. Induced abortion reports are sent in directly by physicians, hospitals and clinics.

HISTORICAL BACKGROUND

This marks the 64th year of statewide collection of birth and death records, begun in 1917. Florida was admitted to the Death Registration Area in 1919, and to the Birth Registration Area in 1924, by virtue of having met all U.S. Bureau of Census criteria. Marriage and dissolution records have been filed with VS since June 1927, abortion reports since April 1972.

RESIDENT AND RECORDED EVENTS

Births and deaths are tabulated according to both usual place of residence (events occurring to Florida residents regardless of place of occurrence) and place of occurrence (events occurring in Florida regardless of usual residence). The former are herein referred to as resident, the latter recorded, events. Resident data have been tabulated since 1933, the year in which interstate exchange of vital records began. Prior to 1933, only recorded data are available.

Varying interpretations of "Usual residence" by Florida's many seasonal visitors and military families may influence the accuracy of resident tabulations to some extent, since the residence stated on the certificate is normally accepted without question. Institutional deaths, wherever possible, are allocated to the county from which the person was admitted. For births and stillbirths, the mother's residence is used when it differs from the father's.

Marriage, dissolution and abortion data are by place of occurrence only; there is no interstate exchange of these records. However, Florida dissolutions of marriage are granted to legal residents only; so there can only be resident dissolutions.

CAUSE OF DEATH

The underlying cause of death is determined from death certificate medical information in accordance with procedures established by the World Health Organization and the National Center for Health Statistics (NCHS). Standardized codes are assigned from the International Classification of Diseases (ICD).

To keep abreast of changes in medical knowledge ICD is revised approximately every 10 years. Revisions and years used in Florida are:

Revision	Years Used.	Revision	Years Used
Second	1917-1920	Sixth	1949-1957
Third	1921-1929	Seventh	1958-1967
Fourth	1920-1940	Eighth	1968-1978
Fifth	1941-1948	Ninth	1979-

Due to these revisions, some of which involve major changes, year-to-year comparisons of deaths by cause can be misleading, unless such comparisons span a period of years in which only one revision was used, or the changes from one revision to another were minor.

The Ninth Revision contains major modifications of some sections, so that more deaths are now assigned under Eighth Revision rules, and vice versa. NCHS coded a sample of 1976 U.S. deaths by both Eighth and Ninth Revision rules. The results were grouped by major causes, and for each of these, the number of Ninth Revision deaths was divided by the number of Eighth Revision deaths to produce a comparability ratio. For example, the comparability ratio for Suicide is 1.0032; this implies that Ninth Revision coding of a given set of death certificates will produce about 32/100ths of one percent more Suicides than would Eighth Revision rules.

National comparability ratios are shown in Table M for Florida's leading causes of death. When comparing deaths from these causes for 1979 or later to those for 1968-78, the ratio multiplied by the earlier data (either number of deaths or death rate) will yield an approximation of the data which would have resulted under Ninth Revision rules.

AVAILABILITY OF DATA

In addition to data presented here, much greater detail is available from unpublished tables upon request. Also special statistical tapes and tables may be requested on a fee-for-service basis. Information concerning data available from these sources may be obtained from Public Health Statistics Section, P.O. Box 210, Jacksonville, Fla. 32231 Phone (904) 354-3961, or SUNCOM 673-3180.

RACE

Race is usually counted as it is stated on birth, death and marriage certificates, with such designations as "Hispanic" counted as white. For births, the child is counted as white if both parents are white, or if one is white and the other unknown or not stated; the child is counted as nonwhite in all other cases where the race of at least one parent is known; the race is left as unknown or not stated only when both parents are unknown. Specific nonwhite races are assigned according to a somewhat complex coding procedure, copies of which are available on request. The 1970 U.S. Census for Florida showed a population that was 15.3 percent black and less than 0.4 percent other nonwhite races. The 1980 U.S. Census shows 13.8 percent black and 2.2 percent other nonwhite. This increase in the size of the other nonwhite population results mainly from changes in the Census Bureau's definitions.

UNKNOWNS

Tabular totals in this publication may include some records of unknown age, race or sex. In these cases the components shown will not add to the total.

COMPLETENESS OF DATA

Tabulation of data for this annual report was begun after allowing a reasonable time for receipt of late records. A few certificates were received after tabulation and are not included in this report. These records represent only a small fraction of the total, and their omission does not materially alter the facts presented.

ACKNOWLEDGEMENT

Basic tabulations for this report were prepared by the Operations Computer Services, and we gratefully acknowledge the able assistance of Mr. M. E. Gardner, Jr., Information Systems Supervisor.

POPULATION

At midyear 1980 Florida's population had increased by an average of 3.6 percent annually since 1970. This is about 13 percent higher than the growth rate during the previous (1960-70) decade but 39 percent lower than the 1950-60 rate (Table A).

The annual average numerical increase of 294,805 includes a natural increase (excess of resident births over resident deaths) of 23,739 leaving an estimated net in-migration of 271,066 ... or 22,589 per month. This compares with a monthly in-migration of 13,564 in the 1950-60 decade and 11,317 in the 1960-70 decade.

Reflecting the radical change in Census Bureau definitions, the white population increased by 3.2 percent and the nonwhite population by 3.5 percent in 1980. Previously the growth rate for whites was almost double the rate for nonwhites.

The Florida nonwhite population was 16.0 percent of the total in 1980, compared to 16.8 in the U.S. as a whole. The 65-and-over population was at 17.4 percent, far above the U.S. figure of 11.3 percent. The under-15 group was down to 19.1 percent in Florida vs. a U.S. proportion of 22.6 percent.

1980 Midyear population estimates are based on April 1 U.S. Census data, with intercensal estimates based on data from the Bureau of Economic & Business Research, University of Florida.

Based on data from Bureau of Economic & Business Research, University of Florida

GENERAL NATALITY

Florida's resident live births jumped by 10,666 in 1980; 7,796 for whites and 2,881 for nonwhites. This was the largest numerical increase since statewide collection of records began in 1917. The proportional increase over 1979 was 8.8 percent, about the same for both race groups.

The overall rate increased from 12.7 to 13.4 per thousand population, or 5.5 percent, and there was little difference between races in this respect either. The new rates were, in all three cases, the highest since 1972, and they continued a trend which began in 1977 for nonwhites, 1979 for whites.

The rate for nonwhites remains about double the rate for whites.

Table B

RESIDENT LIVE BIRTHS AND RATES PER 1000 POPULATION BY RACE, FLORIDA, 1950, 1960 AND 1970-1980

1977	110,883	80,947	29,890	12.3	10.7	20.9
1978	113,367	82,304	31,033	12.3	10.6	21.1
1979	121,145	88,712	32,403	12.7	11.1	21.3
1980	131,811	96,508	35,284	13.4	11.7	22.4

FERTILITY

The general fertility rate in 1980 was 63.4 vs. a 1974-76 average of 60.9, per 1000 women age 15-44. The increase for whites was 3.5 percent - for nonwhites 4.8 percent. The rate for nonwhites is now 66.1 percent higher than the rate for whites.

Fertility was down for both the teenage groups and for those 40 & over. The large fertility increases were in the ages between 20 and 39, especially the 30-34 age group. Among white women the age-specific fertility increase was 23 percent in the 30-34 age group, 14 percent in the 35-39 group, negligible from 20 to 29. Among nonwhite women the increases started at somewhat younger ages: 7 percent for the 20-24 group, 20 percent for 25-29, 28 percent for 30-34 and 14 percent for 35-39.

Median age of white mothers reached its highest point since 1958 at 25.1 years. Median age of nonwhite mothers reached its highest point since 1967 at 23.0 years.

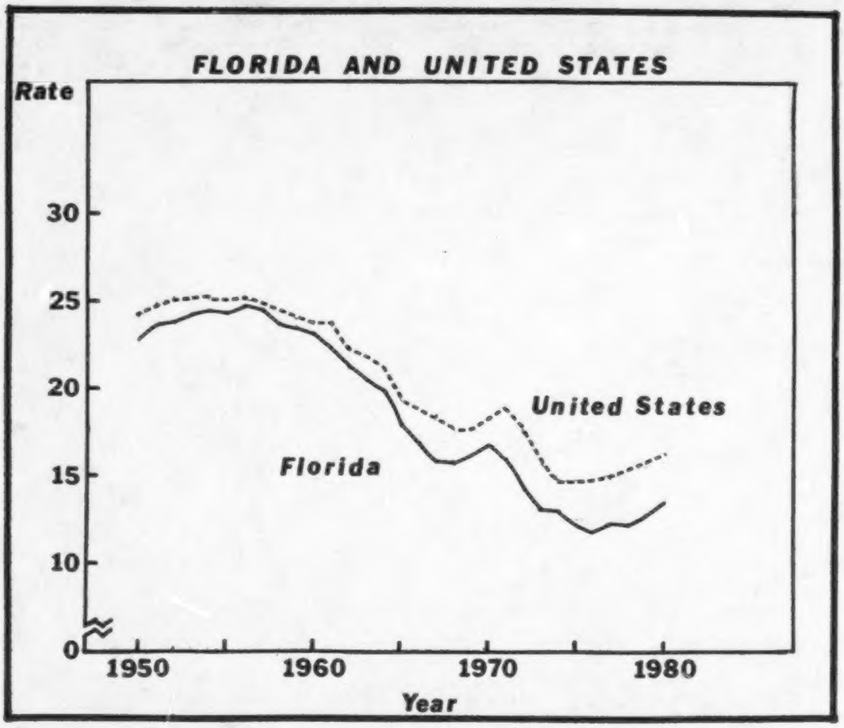
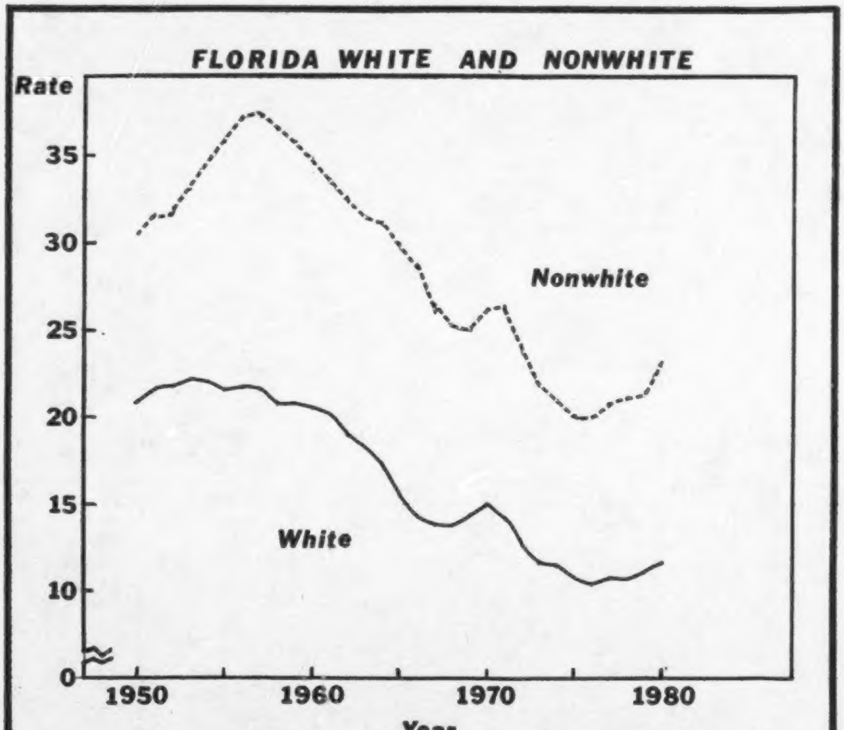
Figure 2

RESIDENT BIRTH RATES PER 1000 POPULATION
1950-1980





BIRTH ATTENDANTS

By 1960 most white births were in hospital, and nonwhite births were approaching the same high proportions. Maternal and perinatal mortality had been reduced by general advances in medical knowledge, increasing proportions of deliveries by physicians, training and licensing of midwives.

The proportion of hospital deliveries showed very little change from 1979 to 1980 ... 94.5 percent overall, 95.5 percent for whites, and a slight increase among nonwhites from 91.7 to 91.9 percent. Since birthing centers are licensed maternity hospitals, they are not distinguishable from other hospitals in current statistics.

There was a small increase in midwife deliveries, from 3.1 to 3.3 percent for whites, 6.5 to 6.6 percent for nonwhites. Physician deliveries remained at 95.8 for whites and rose slightly to 92.6 percent among nonwhites.

LOW-WEIGHT BIRTHS

Birthweights under 2500 grams (5 1/2 lbs.) are arbitrarily called low-weight. There are inherent normal differences in birthweight distribution between sexes. Females generally weigh less but have lower infant mortality. On the other hand, studies have shown that the risk of neonatal mortality is much higher for low-weight births than it is for "normal" weights. Table E shows that proportions of low-weight births in Florida have declined over the past decade.

Table E

PERCENT OF LOW-WEIGHT* RESIDENT LIVE BIRTHS, BY RACE & SEX, FLORIDA, 1969-1980

*Under 2500 grams (5 1/2 lbs.)

BIRTHS TO UNWED MOTHERS

In the decade since 1970 the percentage of white mothers who were unmarried has grown from 6.5 to 10.5, but these percentages are still quite small in comparison with those for nonwhites: from 41.1 to 55.9 in the same period. Since 1973 more than half of all nonwhite mothers have been unmarried (Tables F and G, Figure 3).

INDUCED ABORTIONS

Induced abortions have been legal in Florida since April, 1972. The 1980 pregnancy rate among females of childbearing age was 9.4 percent, and the induced abortion ratio was 31.6 per 100 pregnancies.

Table H

REPORTED TERMINATIONS OF PREGNANCY IN FLORIDA

*Stillbirths of 20 or more weeks gestation

FETAL DEATHS (STILLBIRTHS) 20 WEEKS

In Florida, a fetal death certificate is required when the gestation period is 20 or more weeks. These deaths usually result from "spontaneous", i.e., not induced, abortions. Thus the probability that a given event would be included in both statistical entities, Induced Abortions and Fetal Deaths, is extremely low.

The fetal death ratio per 1000 live births continued at a record low in 1980, with a slight increase in the ratio for whites and a decrease for nonwhites (Table 1, Figure 4).

Table I

RESIDENT FETAL DEATHS* WITH RATIOS PER 1000 LIVE BIRTHS, BY RACE, FLORIDA, 1950, 1960 & 1970-1980

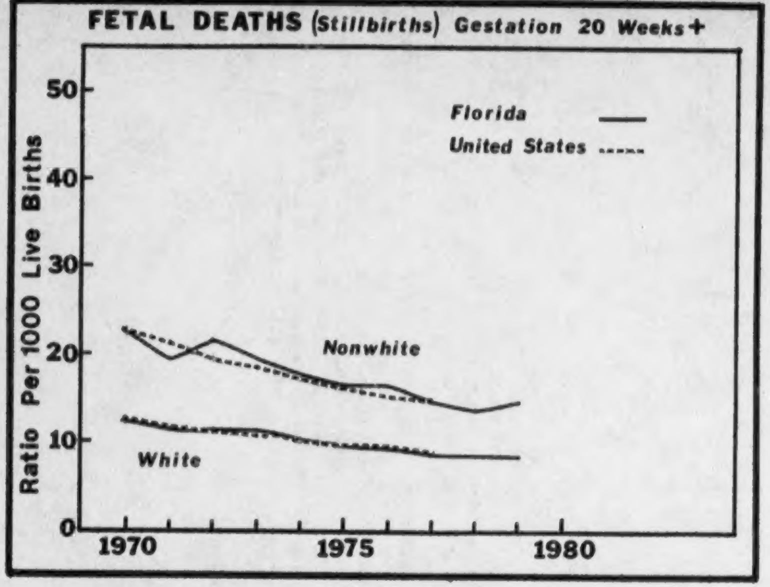
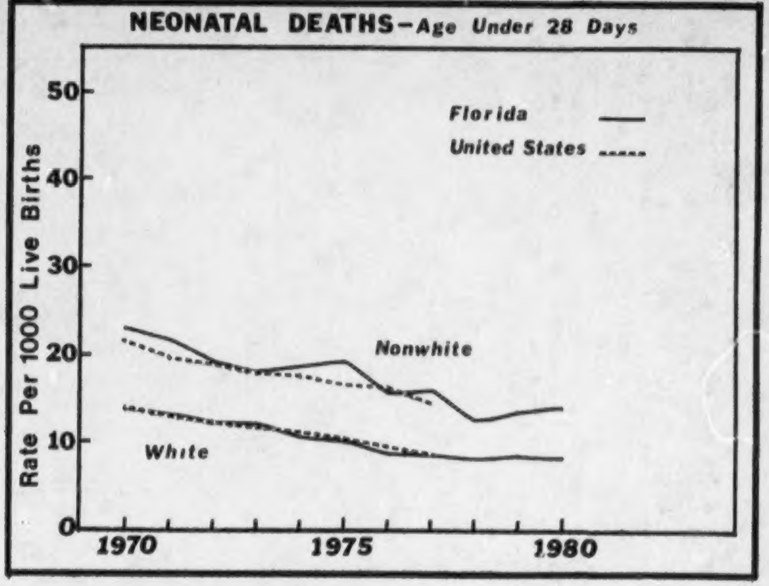
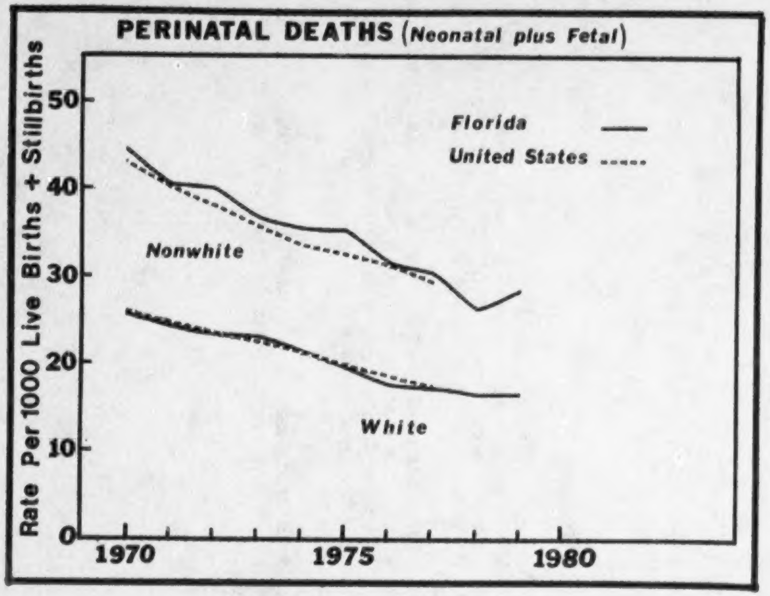
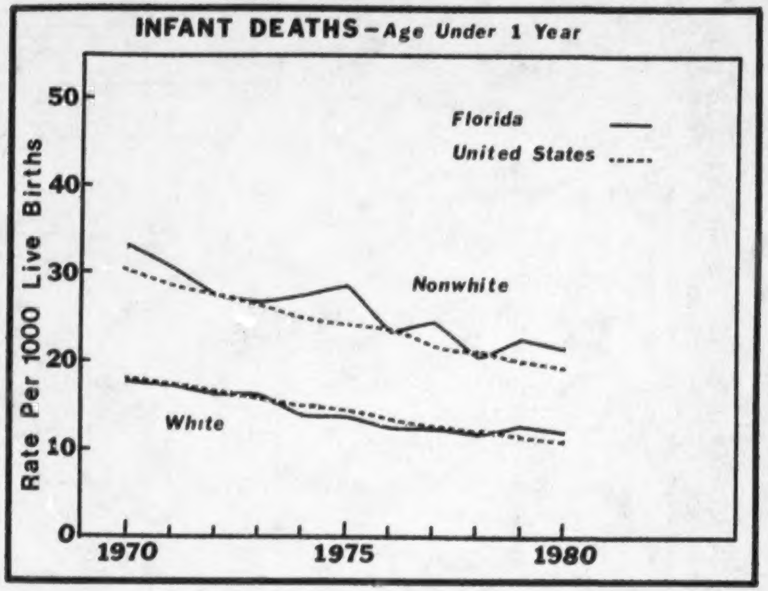
RESIDENT FETAL, NEONATAL, PERINATAL, & INFANT MORTALITY BY RACE; FLA. & U.S., 1970-80









GENERAL MORTALITY

Florida's resident deaths for 1980 exceeded 100,000 for the first time, and the rate rose to 10.6 per 1000 population. Although the general trend in the state's mortality has been upward since 1950 due to immigration of retirees, the rate dropped in 1974 and 1975. It now appears to be climbing again (Table L, Figure 5). In 1980 the rate for whites rose to 11.2, while the rate for nonwhites to 7.5 per 1000.

The age-adjusted death rates rose slightly to 5.7 overall and 5.5 for whites, while the rate for nonwhites was unchanged at 6.7 per 1000. These rates imply that, if age distributions were the same as a standard population for both race groups and remained constant from year to year, (1) nonwhites would have higher death rates than whites, 6.7 vs. 5.5 per 1000 in 1980, (2) mortality would have shown a decline for both groups since 1950, and (3) Florida would have a slightly lower death rate than the U.S. as a whole. The U.S. age-adjusted rate for 1980 was 5.9 vs. 5.7 for Florida (Table L, Figure 5).

CAUSES OF DEATH

Table M shows Florida's leading causes of death, 1970 and 1980. Heart, Cancer, Stroke and Accidents continued as the top four, accounting for 71.6 percent of all 1970 deaths and 73.6 percent in 1980.

COLD (Chronic Obstructive Lung Disease & Allied Cond.) rose to fifth, swapping places with Pneumonia-Influenza, now sixth. Cirrhosis rose to seventh while Diabetes remained in eighth position. Suicide and Homicide rose to ninth and tenth respectively.

Perinatal Conditions, seventh in 1970, has dropped to twelfth. Atherosclerosis has dropped one notch to eleventh.

Among whites cause-of-death rankings were the same as the overall rankings for the first seven causes, but Suicide, Diabetes and Atherosclerosis were eighth, ninth and tenth respectively.

Among nonwhites the first four causes were the same, but the fifth cause of death was Homicide, the sixth was Perinatal Conditions, the seventh Diabetes, eighth Pneumonia-Influenza, ninth Cirrhosis and tenth COLD. The ranks of Atherosclerosis and Suicide were not determined for nonwhites, but the latter has been an historically negligible cause of death for Florida nonwhites.

HEART DISEASE

The unadjusted Heart Disease death rate rose again in 1980, but there has really been no discernible secular trend during the decade of the 1970s.

The age-adjusted rates for this cause indicate improvement over the past two decades. Heart Disease is still Florida's, and the nation's, leading cause of death, as it has been for more than 50 years. Differences between unadjusted rates for males and females are not due to age distribution; but between rates for whites and nonwhites, age distribution appears to be the primary factor, since there is a mucher higher proportion of older people among whites. The age-adjusted rates for nonwhites (not shown) are much higher than those for whites.

Ischemic (Atherosclerotic) Heart Disease was the cause of about 79 percent of these deaths among whites and about 59 percent among nonwhites. Hypertension-related Heart Disease, on the other hand, caused only 3 percent of Heart deaths among whites but 18 percent among nonwhites.

CANCER (MALIGNANT NEOPLASMS)

Malignant Neoplasms have risen in death rate for 30 consecutive years, partly due to population aging. However, the age-adjusted rate showed a probable increasing trend even in a Florida population with stabilized age distribution.

Males have higher Cancer death rates than females, and rates for whites are higher than for nonwhites, although the racial difference, again, is primarily attributable to the aging of the white population.

Five principal types of Cancer are those of the Digestive System, Respiratory System, Genital Organs, Breast and the Leukemias. Respiratory Cancer has far out-stripped the others in rate of increase for the last 30 years, having more than quadrupled in rate, from 15.5 to 69.3 deaths per 100,000 population, and now exceeds the Digestive Cancer death rate, which rose only 41 percent (Table Q).

The Leukemia death rate nearly doubled in this period as did the rate for Breast Cancer, while Genital Cancer rose by only 11 percent.

The smaller increases in Genital, Breast, Digestive Cancer and Leukemia are probably a reflection of earlier detection and treatment methods, combined with intensive public education efforts, the Pap smear for females Genital Cancers, self-examination for Breast Cancers, and chemotherapy for Leukemias.

1980	241.6	63.9	69.3	28.3	18.4	8.4

STROKE (CEREBROVASCULAR DISEASE)

Stroke continued as the third leading cause of death, but both the crude and age-adjusted rates have declined quite consistently during the past decade.

Females have higher Stroke death rates than males, and whites have higher rates than nonwhites. Again, both of these differences are due to aging, since age-adjustment in both cases gives an opposite effect, i.e., males have higher age-adjusted Stroke death rates than females, and nonwhites have much higher age-adjusted rates than whites.

Table R

RESIDENT CEREBROVASCULAR DISEASE DEATH AND DEATHS RATES PER 100,000 POPULATION, BY RACE AND SEX, FLORIDA, 1950, 1960 AND 1970-1980

AA: age-adjusted to U.S. 1940 standard population

ACCIDENTS (BY PLACE OF ACCIDENT)

Accident mortality increased in 1980 both in number and rate, with the largest percentage increases in rate among nonwhite males 9.1, females 8.9. White male accident mortality rose by 7.3 percent, white females by 1.9 percent.

Males have much higher accidental death rates than females, and nonwhite males have higher rates than white males. Among females, however, the reverse is true, at least in recent years: white females have higher rates than nonwhite females.

Deaths occurring to skin and scuba divers are not directly classifiable by ICDA codes. For this reason, and because of growing concern, a special record has been kept since 1960 of Florida deaths in connection with this increasingly popular but dangerous sport.

Table U shows 21-year results of the study. Of 493 deaths, 228 occurred in salt water (ocean, gulf, bay, river mouth) and 265 were in inland waters (sink hole, spring, lake, upriver, canal, rockpit, pool). Of the latter, 211 occurred in underwater cave explorations. Monroe, Dade, Broward, Palm Beach, Pinellas, Bay, Okaloosa and St. Lucie counties had a total of 221 deaths ... most of the salt water group. Suwannee, Gilchrist, Volusia, Holmes, Walton, Hernando, Levy, Marion, Columbia, Jackson, Wakulla, Alachua and Madison had a combined 227 ... most of the fresh water deaths. The latter group of 13 counties also accounted for 200 of the 211 cave diving deaths.

468 of the victims were male, 456 white and twelve nonwhite; the other 25 were white females. Median age was 24.3 years.

For the last twelve years of the study, 1969-1980, residence data show that 160 of 369 victims, or 43.4 percent, were from out of state. Among cave divers 90 of 152 or 59.2 percent, were nonresidents.

CHRONIC OBSTRUCTIVE LUNG DISEASE & ALLIED CONDITIONS

The cause group which included Bronchitis, Emphysema and Asthma has been expanded to include some minor diseases plus the increasingly-used general term: Chronic Airways Obstruction. These causes combined, and referred to as Chronic Obstructive Lung Disease and Allied Conditions, now constitute the fifth ranking cause of death.

This cause group is probably more directly related to cigarette smoking and/or air pollution than any other ... with the exception of lung cancer.

The death rate in 1980 for white males was higher than the combined rates of the other three race-sex segments for this cause. The rate for white females has increased much more rapidly over the past decade, but the trends for nonwhites are not yet clear.

Despite the overall increase in rates, however, the age-adjusted rate showed only a small increase.

PNEUMONIA & INFLUENZA

Deaths from Pneumonia and Influenza ("Flu") are reported together because of the close relationship between the two causes. Although Flu deaths normally constitute a very small fraction of the total, there is usually a great increase in Pneumonia deaths during Flu epidemic years. There is little doubt that most of these excess Pneumonia deaths were originally Flu cases.

Florida's 1980 Penumonia-flu death rate was up slightly, but the long-term trend was still downward. The age-adjusted rate is less than half of the crude rate, reflecting again the fact that this cause of death affects mostly older people, and Florida has a high proportion of elderly.

Table W

RESIDENT PNEUMONIA & INFLUENZA DEATHS AND DEATH RATES PER 100,000 POPULATION, BY RACE AND SEX, FLORIDA, 1950, 1960 AND 1970-1980

AA: age-adjusted to U.S. 1940 standard pop.

CHRONIC LIVER DISEASE & CIRRHOSIS

In 1980, 35 percent of the Chronic Liver Disease deaths were specified as associated with alcoholism; the rest had no mention of alcohol, but there is little doubt that many of these were also alcohol-related.

There was an increase in overall Cirrhosis mortality for 1980, although the age-adjusted rate dropped slightly.

Males have higher Cirrhosis death rates than females; this is true for all races and remains the case after age-adjustment. Racial differences, however, are strongly affected by age distribution. Table X shows quite similar rates for whites and nonwhites; but after age-adjustment the rate for nonwhite males is much higher than the rate for white males, and nonwhite females have a much higher rate than white females.

Table X

RESIDENT CHRONIC LIVER DISEASE & CIRRHOSIS & RATES PER 100,000 POPULATION, BY RACE AND SEX, FLORIDA, 1950, 1960 AND 1970-1980

AA: age-adjusted to U.S. 1940 standard population

DIABETES MELLITUS

Diabetes is another disease in which the death rate rises sharply with age, and this is the main reason for Florida's general increase in Diabetes death rate, which persisted until 1973. Since that time there has been a downtrend, probably due to improved treatment methods.

After age-adjustment, nonwhites have much higher Diabetes mortality than whites. Nonwhite females have the highest mortality and white females the lowest; nonwhite males have the second highest and white males of course the second lowest.

SUICIDE

Suicide, the ninth-ranked cause of death in 1980, showed a long-term increase in rate from 11.2 in 1950 to 17.3 in 1977 but has since decreased to 15.5 suicides per 100,000 population.

A higher proportion of widowed/separated/divorced persons, who are known to have high suicide rates, and of other displaced persons who have left their homes to come to Florida, probably accounts for much of the difference between the Florida and U.S. Suicide rates (15.5 vs. 12.7 in 1980).

Whites have much higher suicide rates than nonwhites, and males are higher than females in both race groups.

Table Y

AA: age-adjusted to U.S. 1940 standard population

HOMICIDE

Homicide became the tenth cause of death in 1980, displacing Atherosclerosis. The 1520 Homicide deaths was only two less than the total of Suicide deaths. The unprecedented numerical increase of 354 was largely due to an increase of 211 in Dade County and 44 in Broward.

Age-adjustment of the Homicide rate in Florida results in a slightly higher rate, reflecting the fact that Homicide victims are generally younger people who comprise a relatively small proportion of Florida's population.

The largest rate increases in 1980 were among white males, 37 percent, and nonwhite males, 30 percent. White females had a rate increase just under 10 percent, and the rate actually decreased by 3 percent for nonwhite females.

TUBERCULOSIS

Once Florida's leading cause of death (1917), Tuberculosis now ranks about thirty-second among major cause groups. The general trend since 1950 has been downward, although there remains a dangerous reservoir of infection which needs to be monitored.

Tuberculosis death rates are highest for nonwhite males, then nonwhite females and white males, with white females having less than one death per 100,000 population.

LEADING CAUSES BY AGE (TABLE CC)

INFANTS (Under 1 Year)

The infant death rate per 100,000 infant population* dropped about 36 percent between 1970 and 1980. Perinatal Conditions and Congenital Anomalies (Birth Defects) continued as the two leading causes, accounting for 73 percent of infant deaths in 1970 and 71 percent in 1980. Sudden Infant Death Syndrome, classified as a separate cause of death since 1974, and estimated here for 1970, has now become the third cause of infant death; it is the leading cause after the second week of life. Accidental deaths, now fourth, dropped in number and rate over the decade, but Pneumonia-Influenza registered a much greater decrease and is now in fifth position.

1 - 4 AGE GROUP

There was a 23 percent drop in overall death rate for the 1-4 age group during the decade. Accidents remained as the leading cause of death for this age group ... Drownings and Motor Vehicle Accidents were the principal types. Because of the small numbers of deaths in this age group the rankings vary considerably from year to year. For 1980 Congenital Anomalies ranked second, Cancer was third, Homicide fourth, and Heart Disease fifth. All of these causes had decreases in rate except Homicide which jumped to 15 deaths and a 1980 rate of 3.4 deaths per 100,000 age-specific population. Pneumonia-Influenza was second in 1970, Meningitis fifth, and Meningococcal Infection seventh.

5 - 14 AGE GROUP

The overall death rate for the 5-14 age group fell by 29 percent during the decade. Accidents and Cancer remained as the two leading causes. Congenital Anomalies, Homicide and Heart Disease were the next three causes. Pneumonia-Influenza, 1970's third cause, was no longer among the leading five. All of the leading causes showed decreases in rate except Homicide which rose to 21 deaths and a rate of 1.6 deaths per 100,000 population.

15 - 24 AGE GROUP

The 15-24 age group had the smallest overall decrease in death rate, only 0.6 percent, of the seven groups in Table CC. The five leading causes all had numerical increases, and three of the five had rate increases. Accidents, the leading cause, had a decrease of one percent in rate, while Homicide and Suicide, numbers two and three, had substantial increases: 29 and 70 percent respectively. The Cancer rate dropped by 23 percent, while the Heart Disease rate rose by 71 percent. Pneumonia-Influenza, fifth in 1970, dropped out of the leading cause list for this age group.

25 - 44 AGE GROUP

The overall drop in rate was 27 percent for the 25-44 age group during the decade 1970-1980. The five leading causes in 1970 were also the five leading causes in 1980, but their positions relative to each other were somewhat reshuffled. Accidents remained the leading cause while Cancer rose from third to second; both of these causes had rate decreases. Homicide rose from fourth to third and showed an increase in rate. Heart Disease dropped in number as well as in rank and rate. Suicide remained fifth with a small increase in rate.

45 - 64 AGE GROUP

The overall death rate dropped by 21 percent for the 45-64 age group during the decade. Cancer replaced Heart Disease as the leading cause of death and showed a rate increase of almost two percent. Stroke remained in third position, while Cirrhosis rose to fourth and Accidents fell to fifth. Four of the five leading causes decreased in rate, Cancer being the exception.

65-AND-OVER AGE GROUP

The overall death rate decrease for the 65-and-over age group was eight percent during the decade. Heart Disease, Cancer and Stroke retained their one-two-three rankings with only Cancer showing a rate increase, 14 percent. Chronic Obstructive Lung Disease rose from fifth to fourth with a rate increase of 32 percent. Pneumonia-Influenza dropped to fifth.

*not to be confused with the infant <u>mortality</u> rate shown on page 8

MATERNAL MORTALITY

Florida's 1980 maternal mortality rate of 1.2 maternal deaths per 10,000 live births was equal to the record low set in 1978. The rate for white mothers increased slightly to 0.9, while the rate for nonwhite mothers at 2.0 was a new record low.

Table DD

MARRIAGES AND DISSOLUTIONS

The number of marriages in Florida reached an all-time high in 1980, and the marriage rate rose to 11.0 per 1000 population, equalling the 1973 peak year.

Dissolutions of marriage (including annulments) also reached an all-time numeric high, but the rate remained at 7.3 per 1000.

Many of Florida's dissolutions are granted to persons who establish residency in the state specifically for this purpose; these cases account for most of the difference between the Florida and U.S. dissolution rates, as well as for the high ratio of dissolutions per 100 marriages in Florida, now at 66.1, compared to only 49.0 nationally. This ratio has dropped in Florida for five consecutive years, and as other states become more liberal in their divorce laws, the difference between Florida and the nation will continue to lessen (Table EE, Figure 6).

Table EE

MARRIAGES AND DISSOLUTIONS* OF MARRIAGE, RATES PER 1,000 POPULATION, AND DISSOLUTIONS PER 100 MARRIAGES, FLORIDA, 1950, 1960 AND 1970-1980

LIFE EXPECTANCY

In 1978, life expectancy at birth had increased about 2.9 years for white males and 2.1 for white females in the eight years since 1979, while it had increased by about 2.9 years for nonwhite males and 4.5 for nonwhite females. White females continued to have a much greater expectancy, 78.9 years, than any other population segment, followed by nonwhite females at 72.4 years, white males at 71.3 years, and nonwhite males at 62.2 years. Data for 1979-80 were not available at press time (Table FF).

Table FF

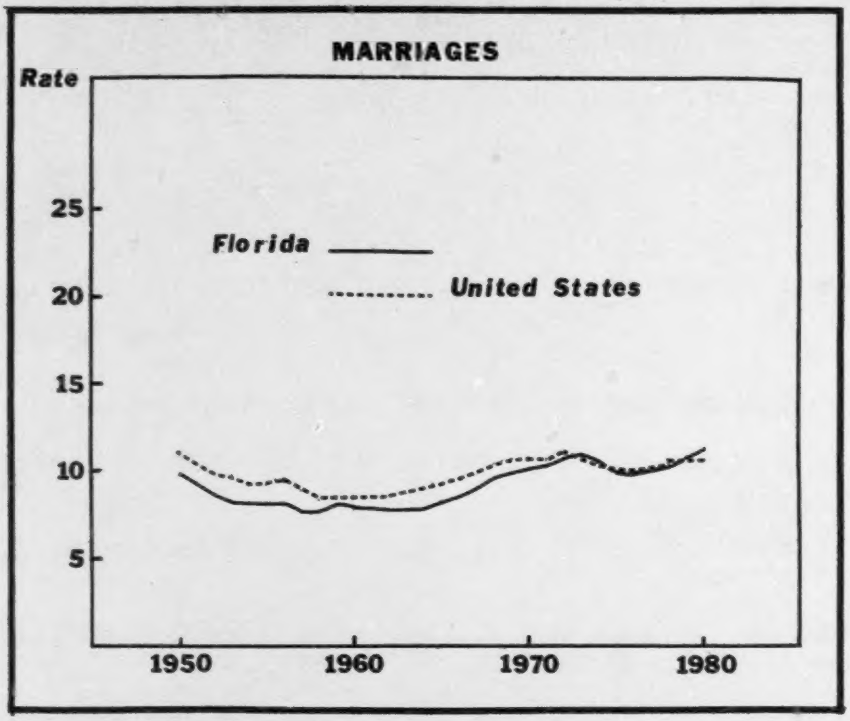
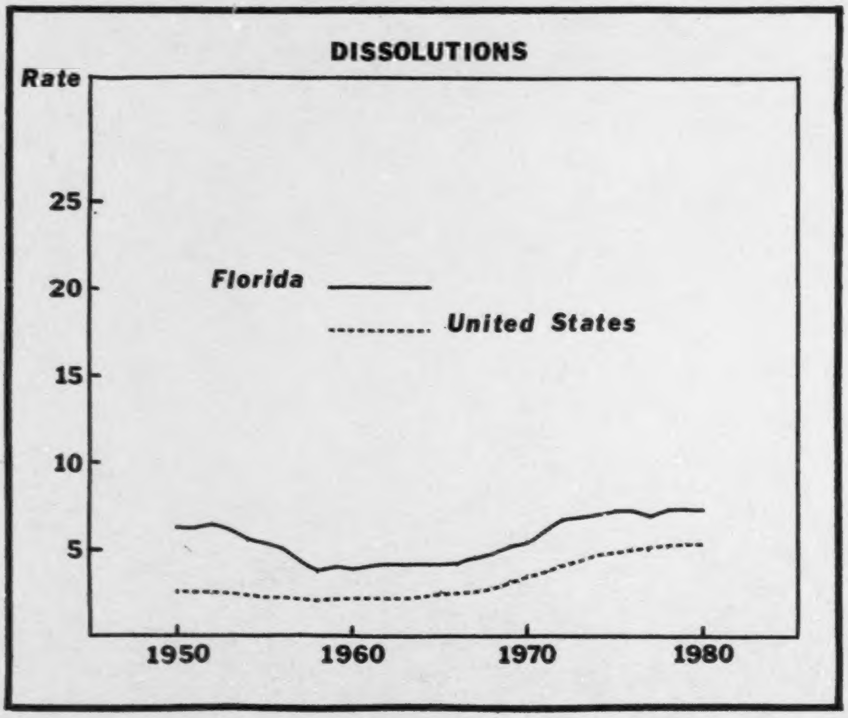
Figure 1

MARRIAGE, DISSOLUTION RATES PER 1000 POPULATION FLORIDA AND UNITED STATES, 1950-1980





The following procedures and symbols are used in Tables 1 through 27.

(1) All rates and ratios are rounded to the nearest tenth.

(2) All rates and ratios that calculate to less than 0.05 are printed as "0.0".

(3) Undefined rates and ratios, i.e., those with denominator of zero, are printed as "- - -".

(4) Anomalous rates and ratios, i.e., those that calculate to greater than 999.9, are also printed as "- - -".

(5) Unreliable rates and ratios, i.e., those with denominator less than 100, are followed by an asterisk "*".
